

The Incidence of Suicide among Children

PRESENTED BY THE ALABAMA SUICIDE PREVENTION AND RESOURCES
COALITION (ASPARC)

FUNDED BY THE GARRETT LEE SMITH GRANT

Suicide among American Children

- Between 1999 and 2015:
1309 Children ages 5 to 12 killed themselves in the U. S.
- The frequency of child suicide increased between 2013 and 2016.
- **33 children under 12 die from suicide in the US each year (2015).**
- **By age 9, children understand the term “suicide.”**

Suicide among American Children

- Suicides among children 5 to 11 years old and children 12 to 14 differ with respect to some key characteristics and risk factors.
- Children in both age groups lived in highly dysfunctional families with constant conflict between relatives and friends.
- Among 5 to 11 year olds, ADD/ADHD were the most common mental illness diagnoses (60% vs. 29%). At any age, these children were very impulsive in responding to frustration.
- Among 12 to 14 year olds, depression, violent mood swings, and boyfriend/girlfriend problems were most common (66% vs. 33%).

Suicide among American Children

- In both groups 75% of suicides were male.
- In both groups females attempted more often.
- In both groups about 30% disclosed their intent to die to another person.
- Among 5 to 11 year olds, 37% of suicides were by African-American children. This is a higher percentage than among any other age grouping.

Suicide among American Children

- It is likely that young black children experience more violence and traumatic stressors and are less likely to receive any treatment for mental health problems.
- 5 to 11 year olds almost always died from hanging/strangulation and suffocation.
- 12 to 14 year olds died from the above, as well as gunshot wounds and other causes.
- Children in both groups almost always died at home.

Suicide in Children

- Labeling self-inflicted death as “suicide” for those under 10 is controversial.
- Between 1999 and 2015, 1309 Children ages 5 to 12 killed themselves in the United States.
- The frequency of child suicide increased between 2013 and 2016.
- 33 children under 12 die from suicide in the US each year (2015).
- By age 9, children understand the term “suicide.”

Children 5-11 vs. Children 12-14

- Among 5 to 11 year olds, 37% of suicides were by African-American children. This is a higher percentage than among any other age grouping.
 - It is likely that young black children experience more violence and traumatic stressors and are less likely to receive any treatment for mental health problems.
- 5 to 11 year olds almost always died from hanging/strangulation and suffocation.
- 12 to 14 year olds died from the above, as well as gunshot wounds and other causes.
- Children in both groups almost always died at home.
